***„You must learn from the mistakes of others.
You can't possibly live long enough
to make them all yourself.“***

Sam Levenson (1911-1980), American Author

Background and Motivation

PROBLEM in the calculation of risks and their extent of damage
the impact of human factors is not taken into account

TARGET Improving Patient Safety

HOW through Human Factor based Risk Management (RiDeM-H)
based on an enhanced FMEA that takes the impact and
consequent dependence of human factors into account (HFdFMEA)

WHY to control and manage risks actively and
subsequently to improve patient safety

Customer Usability higher/improved safety (= patient safety)
through proactive (risk) management

Background and Motivation

**Patient Safety &
Patient Satisfaction
as *Standard* in Healthcare**

© Barbara Streimelweger digital2016, Wien, Nov. 2016 7

Human-Factor-based Risk Management

What are the **challenges**?

- calculation of risks
- impact of human factors
- practice of RiDeM
- controlling & monitoring
- supervision of the system

What is the **target** and how can it be achieved?

- increasing patient safety
- active Risk Management
- classification of human factors (RiDeM-H)
- controlling & monitoring results
- supervising the system

© Barbara Streimelweger digital2016, Wien, Nov. 2016 8

Human-Factor-based Risk Management

Purpose

- Improving Patient Safety
- Risk Management
 - Failure Mode and Effect Analysis (FMEA)

Problem Statement

- calculation of risks and their extent of damage
- impact of human factors

Expected Result

- Human-Factor-based Risk Management in Healthcare (RiDeM-H)
- HFdFMEA as new risk assessment method

Human-Factor-based Risk Management

How is it possible

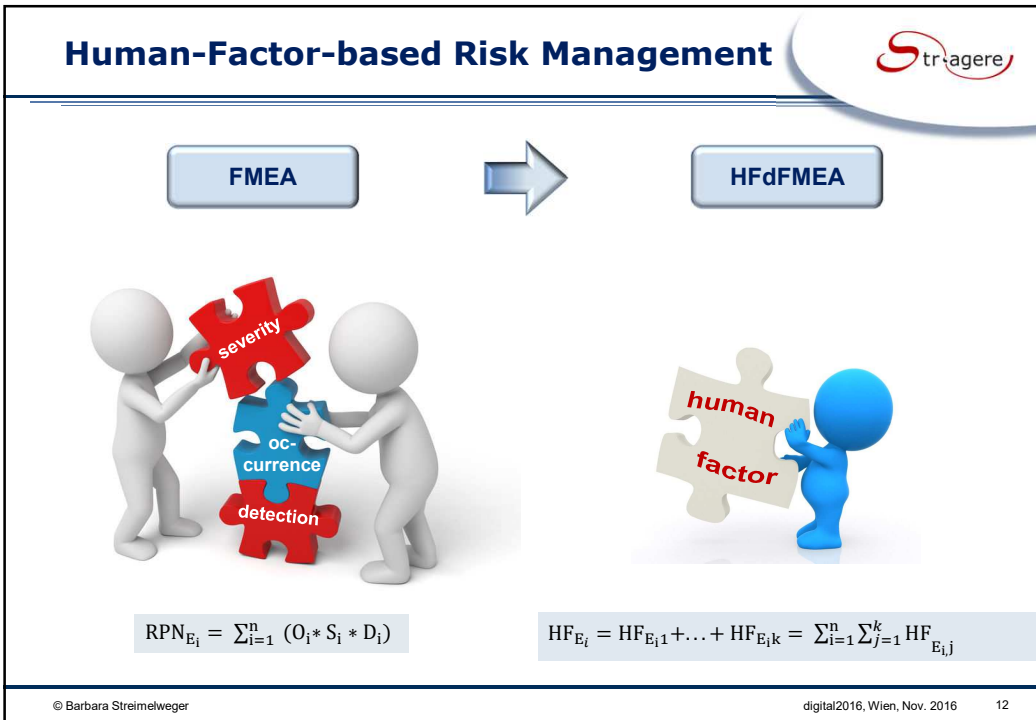

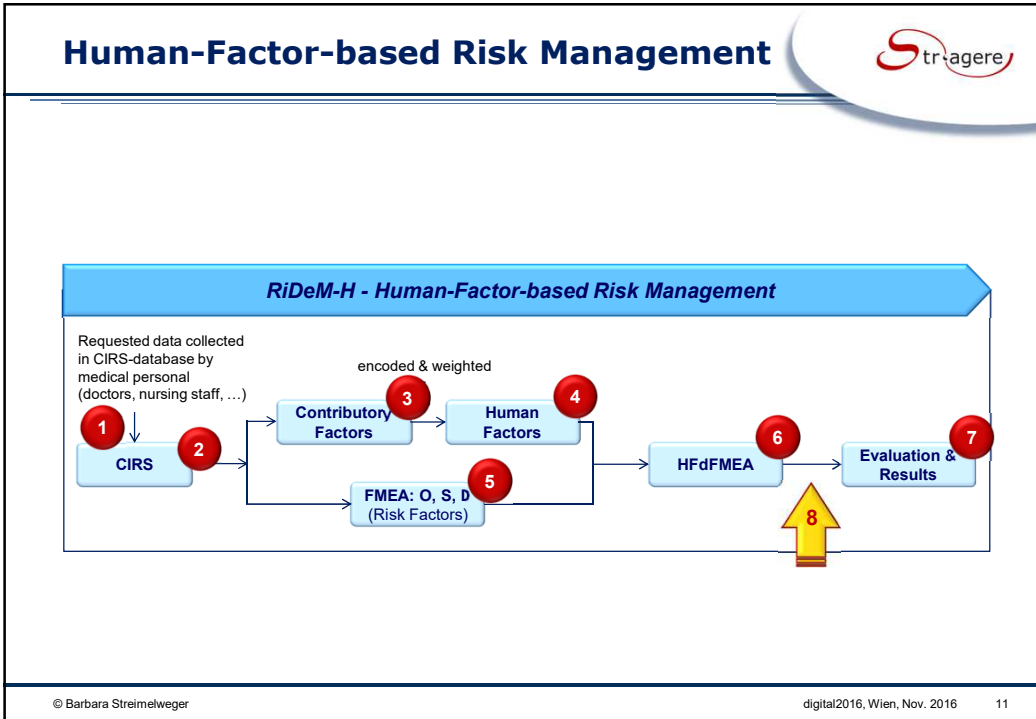

- to **increase patient safety** through active Risk Management
- by **classifying Human Factors** and
- by taking into consideration those Human Factors for risk assessments using FMEA?

How to

- **control**
- **monitor** and
- **supervise**

RiDeM method as such?

Evaluation Setting and Results

□ Data Source

- Critical-Incident-Reporting-Systems (**CIRS**)
- The **GOAL** ... data about incidents/events
- The **USE** ... voluntary national CIRS (e.g. DE, CH, GB, NL, ...) vs compulsory use (e.g. USA, SE)
- The **PROBLEMS** ... access to sensitive data
... accuracy and trustworthiness
... human factors

□ Defined data in CIRS

Each listed event is assigned to ...

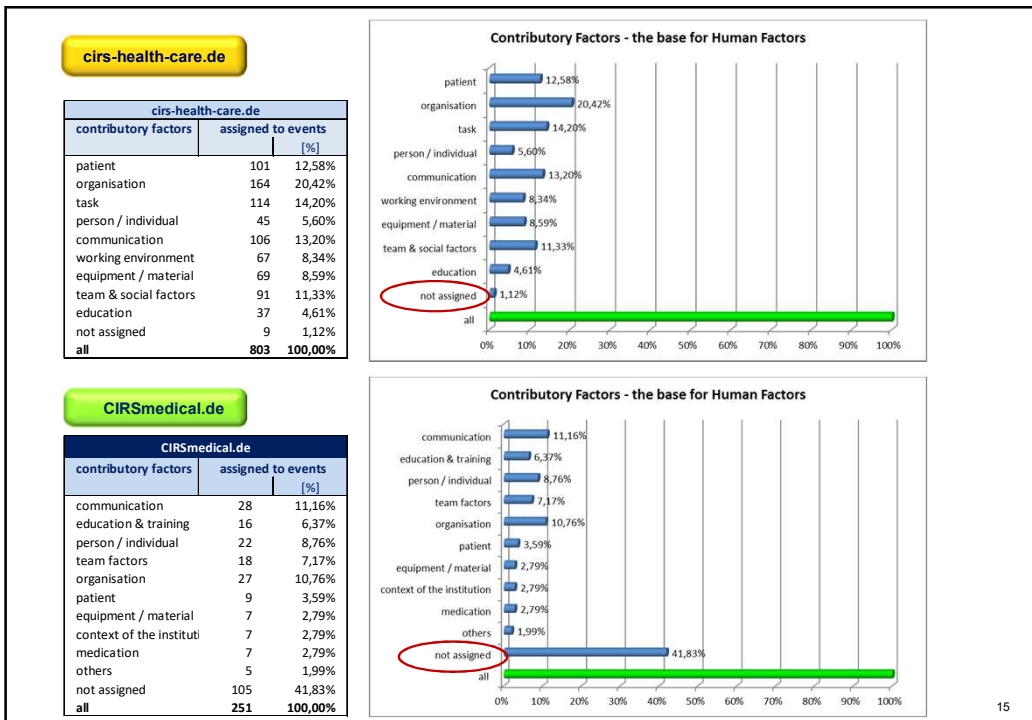

- an expertise area
- a professional category
- a place
- **contributory factors**
- others

Evaluation Setting and Results

Events according to affected area of expertise

15

Restrictions - Limitation - Implications

Medical Expert

Patient

16

Restrictions - Limitation - Implications

- To which **restrictions** and **limitation** lead the **CIRS** databases?
- How **generalised** are the results?
- Who are the **stakeholders** of the proposed HFdFMEA technique and RiDeM-H model?
- What are **implications** for the health system, practitioners and patients?
- What are implications for the HFdFMEA and RiDeM-H?
- Validation of human factors** – why I used multiple linear regression analysis and is there another model that could be recommended for validation of the model?

*What has all this to do with
data protection & data security?*

Conclusion

The proposed method ...

- Human-factor-based Risk Dependent Management (RiDeM-H)** method
 - to control and manage risks actively and subsequently
 - will facilitate to improve patient safety
 - by using HFdFMEA
- mandatory required ...**
 - access to sensitive data, so that HFdFMEA could work

Conclusion

There is still room for improving patient safety

minimizing the risks

taking the given potential chances

We just need to take the opportunities to act!
